Press Release

ABP Technology has selected AG Projects' Name Management solution for Voice over IP

Amsterdam, the Netherlands and Dallas, Texas (February 10, 2004) – ABP Technology Inc. and AG Projects announced today that they will join forces to allow enterprises to preserve their corporate identity in their transition to Voice over IP.

"We have recognized the value of using one address for all communications long before this time. It is now however, when VoIP is being embraced by the market that the concept is making way to reality. ABP's VARS can deliver a complete solution with this new technology and allow their customers to easily chose or preserve their own identify in place of having to switch to yet another numbering scheme. Our solution allows end-users to register or transfer Internet domains, provision corresponding SIP SRV records in the name servers and setup VoIP aliases in a matter of minutes", says Adrian Georgescu, founder of AG Projects.

Robert Messer, President of ABP Technology explains: "Preservation of the corporate identity is crucial for enterprises. The use of existing corporate e-mail addresses for Voice over IP addresses is an important step to enforce and enhance the corporate image when communicating with others. Employees can finally use one single address for all communications regardless of geographical location. The shift from addressing people instead of devices requires integration between SIP signaling, DNS management and Domain Registration. Managed DNS platform provided by AG Projects, bridges these together.

It only took a few years for email to become a key means of communicating. AG Project's Name Management solution allows email addresses like extension@yourdomain.com to be used to make phone calls to everyone in the office. Couple Voice over IP with features like Presence, Roaming and john.doe@company.com becomes the phone number of the future. ABP is excited to offer this new tool to our VAR partners and make DNS management which was always difficult into an easy task for system corporate system administrators, VARs and service providers".

About Managed DNS™

AG Projects Managed DNS™ is a reliable and low cost integrated solution for managing DNS zones, Internet domains, Voice over IP and Telecom numbering plans. Managed DNS™ has been designed to support UMTS (IP version 6), SIP Signaling and ENUM (map PSTN numbers into Internet names). With presence in multiple geographical locations, redundant components, a version control system and a disaster recovery plan, it provides a high-availability carrier class infrastructure.

About AG Projects

AG Projects provides consulting and managed services focused on the convergence of Telecom and Internet into the Next Generation Networks.
